Roll No: _____

Date: _____

Subject Name: _____

INTERCHANGE – 2
ACCOMPLISHMENT

Objective

To develop receptive and productive language competencies through contextual learning, situational conversation exercises, listening comprehension activities, reading tasks, and vocabulary enhancement based on the units in *Interchange 2 Digital Workbook*.

Skills Learned

- Grammar accuracy and sentence construction
- Listening comprehension and information processing
- Reading comprehension and interpretation
- Vocabulary development and contextual usage
- Conversational and interpersonal communication
- Speaking fluency and pronunciation
- Written communication and sentence formation
- Understanding language in real-life situations
- Ability to identify and use appropriate expressions in different contexts
- Independent learning through digital language-learning activities

Learning Outcomes

- Apply grammatical structures accurately in meaningful contexts.
- Understand and respond appropriately to spoken English in different situations.

SELF-INTRODUCTION

My name is Fathima Thameena, and I am a first-year B.E. Computer Science and Engineering student.

Coming to my personality, I would describe myself as an ambivert. I can be both quiet and expressive depending on the situation and the people around me. I am an open-minded, independent, and straightforward person who likes expressing my thoughts while respecting others' opinions.

I am curious by nature and always interested in exploring new things, accepting challenges, and gaining new experiences. I enjoy observing situations, analysing things, and understanding the reasons behind them rather than simply accepting them. I believe in learning through experience and improving myself through every opportunity.

When it comes to learning, I may not be a quick learner, but I prefer understanding concepts deeply rather than memorising them. Once I understand something clearly, I become confident and strong in that particular area. I am also determined, self-motivated, adaptable, and willing to step outside my comfort zone.

My strengths are my determination, independent thinking, curiosity, commitment, and willingness to learn. I believe in respecting people, accepting constructive criticism, and learning from my mistakes. I don't believe in being perfect; instead, I believe in becoming a better version of myself every day.

Coming to my career ambition, my long-term goal is to become a Computer Science professor. I am interested in gaining knowledge, exploring new technologies, and eventually sharing what I learn with others. I believe teaching is not just about explaining concepts but also about inspiring people and helping them grow.

Finally, I would say that I am a person with my own thoughts, goals, and perspectives. I believe that consistency, patience, and determination can help me achieve my dreams.

That's all about me.

Thank you!

IMPRESSIVE PERSONALITY

Professor V. Kamakoti is an eminent Indian computer scientist, academician, researcher and the Director of IIT Madras. He is a personality who represents knowledge, discipline, dedication and innovation. His journey in the field of education and technology reflects the importance of hard work, continuous learning and commitment to excellence.

One of his remarkable contributions is leading the research team that developed SHAKTI, India's first indigenously developed microprocessor. His achievements demonstrate his dedication to making India stronger in science and technology. He has also received several prestigious awards, including the Abdul Kalam Technology Innovation National Fellowship.

Indian Institute of Technology Madras+2

What makes him an inspiring personality to me is his dedication to education, passion for research, leadership and commitment to national development. He motivates young students to think creatively, develop technical skills and contribute something meaningful to society. I admire him not only for his achievements but also for his contribution to shaping the future of education and technology.

He inspires me to become a knowledgeable, responsible and dedicated professor who not only teaches students but also guides them to discover their talents, achieve their goals and become successful individuals. I consider Professor V. Kamakoti a role model for my future teaching career.

Why I Choose Professor V. Kamakoti as My Inspiration

1. Passion for Teaching: I admire his dedication to education and his ability to inspire students through knowledge.

2. Commitment to Excellence: His achievements motivate me to give my best in everything I learn and do.

3. Leadership Qualities: His leadership at IIT Madras inspires me to develop confidence, responsibility and decision-making skills.

4. Love for Research: His contributions to computer science encourage me to explore new technologies and develop innovative ideas.

5. Continuous Learning: His academic journey teaches me that learning should never stop, regardless of age or achievements.

6. National Contribution: His work towards developing indigenous technology inspires me to contribute to India's scientific and technological growth.

7. Student Motivation: I admire how his professional journey represents the importance of guiding and encouraging the next generation.

8. My Career Goal: As someone who wishes to become a Computer Science professor, I see him as a role model who represents the kind of educator I want to become.

How He Inspires My Future

I aspire to become a Computer Science professor who shares knowledge, encourages creativity and helps students discover their potential. I want to develop not only my technical knowledge but also my communication, leadership and teaching skills.

Professor V. Kamakoti inspires me to believe that a professor's responsibility goes beyond completing a syllabus. A true professor creates curiosity, builds confidence and shapes the future of students.

My ultimate ambition is to become a professor who leaves a positive impact on students, just as Professor V. Kamakoti inspires me today.

“A great teacher doesn't just teach a subject; a great teacher inspires students to build a better future.”

NPTEL SUMMARY

Development of Soft Skills and Personality

Week 1: Foundations of Soft Skills, Human Perception, and Self-Management

Week 1 establishes the foundational framework for soft skill enhancement and personal growth, highlighting that genuine soft skills development requires experiential learning transformation rather than cosmetic rote learning. The curriculum examines how personal perceptions shape our interactions, noting that human relationships dictate eighty percent of our personal happiness. Stephen Covey's principle of "beginning with the end in mind" is introduced to urge learners to evaluate daily tasks against long-term objectives and eliminate non-value-adding habits.

Perception is famous illustrations, showing that people often view identical realities through contradictory subjective lenses or prejudices. To overcome misperceptions, learners must seek first to understand before demanding to be understood, cultivating empathy to bridge interpersonal divides.

The curriculum transitions inward to self-management skills, establishing a core set of nine personal faculties: self-awareness, self-confidence, mindset, emotional balance, stress handling, coping with failure, patience/trustworthiness, perceptiveness, and spiritual intelligence. Living with both emotional balance and spiritual intelligence builds deep personal credibility, rendering external negative criticism inconsequential.

The pursuit of excellence is examined through psychological models, contrasting the "law of abundance" (which fosters optimism, courage,) with a "poverty of mind" (which breeds scarcity and fear-driven choices). Abraham Maslow's hierarchy is utilized to show that aspiring to self-actualization—the highest growth need—is vital, as individuals who leave their potential unactualized remain unhappy.

Finally, David McClelland's achievement motivation theory (N-Ach) and Danah Zohar's principles of spiritual quotient (SQ) demonstrate how individuals can view life as a meaningful project rooted in truth, goodness, and beauty.

Week 2: Conflict Resolution Paradigms and Stress Regulation

Week 2 tackles conflict resolution and stress management, framing both as inevitable realities of human interaction that must be embraced rather than avoided. Conflicts are defined as natural disagreements that can lead to constructive growth if handled properly, while destructive escalation typically stems from improper communication.

The progression from interpersonal negotiation to mediation and arbitration is explored, with the primary objective being the attainment of sustainable win-win solutions. Interpersonal case studies—such as husband-wife and father-son disputes—demonstrate the necessity of both viewpoints while remaining attentive to third-party contingencies that are often overlooked.

Becoming a conflict resolution expert requires shifting focus from demanding rigid solutions to asserting core needs. The lecture categorizes conflict into intrapersonal, interpersonal, and intergroup dimensions, identifying intrapersonal conflicts as the most difficult to resolve. When viewed constructively, conflict strengthens relationships, fuels self-growth, and boosts productivity through styles such as collaboration or compromise.

The focus then shifts to regulating stress, defined as an imbalance between situational demand and individual supply. The syllabus differentiates between positive stress (eustress), which mobilizes energy, and distress, which degrades performance. Because employers view chronically stressed individuals as liabilities rather than resources, managing stress through physical fitness, adequate sleep, mindful planning, and simple relief rituals (such as walking in nature, deep breathing, or listening to music) is presented as an essential professional requirement.

Week 3: Habit Formation, the Habit Cycle, and Productivity

Week 3 explores the psychology of habits, defining them as unconscious responses triggered by environmental stimuli. Debunking the myth that habits can be formed or altered effortlessly, the instruction emphasizes that constructive habits require rigorous cultivation, whereas destructive habits form easily through peer influence and leave lasting marks on character.

The habit cycle is broken down into its fundamental mechanics: thought/stimulus leading to action/reaction, which receives reward or punishment, solidifies into habit, builds character, and ultimately yields life success or failure.

Drawing from literary examples such as R.K. Narayan's The Guide and William Golding's Lord of the Flies, the lectures illustrate that while the capacity for base impulses exists within us, the moral resolve to change and foster noble habits also resides entirely within our conscious choice.

Breaking destructive habits requires understanding the neurological role of dopamine, which induces feelings of pleasure and can either reward constructive challenges or anchor harmful addictions.

A cornerstone of the week's study is the Zeigarnik effect, which describes the human brain's natural anxiety and cognitive burden when confronted with unfinished tasks. Left incomplete, tasks consume mental bandwidth and create internal dissonance. However, by understanding that procrastination is merely an initial starting hurdle, learners can harness the Zeigarnik effect constructively: once an activity is started, the intrinsic drive for completion propels the individual through to the end.

Finally, the week reviews common habits of highly successful people, highlighting the value of diligent hard work, completing extra tasks willingly, working without constant clock-watching, maintaining intense focus on primary goals, and replacing bad routines with positive habits.

Week 4: Listening Dynamics and Professional Telephone Skills

Week 4 focuses on foundational communication skills, identifying active listening and telephone etiquette as critical competencies. Active listening is presented as an energetic, purposeful mental process distinct from passive physiological hearing.

Effective listening requires an active seven-stage sequence: reception, selection, organization, assimilation, interpretation, evaluation, and response. Learners are warned against common misconceptions, such as believing that only speaking expends energy or that good speakers do not need to listen.

Overcoming physical noise, physiological discomforts, and psychological barriers (such as prejudice, partial attention, or emotional bias toward a speaker) requires whole-body engagement, empathetic attentiveness, and the strategic use of silence.

The second half of the week details telephone communication, an arena where the absence of visual non-verbal feedback increases the risk of misunderstanding. Basic telephone skills include preparing

pen and paper before answering, smiling while speaking to convey warmth tonally, pacing speech, and providing verbal encouragements like "I see" and "go on".

Advanced practices focus on clear enunciation to eliminate verbal confusion between similar-sounding words, desk organization, and adherence to professional call frameworks when delivering difficult news.

Essential skills for handling demanding or irate callers involve voice modulation, politeness, jargon avoidance, and proactive problem anticipation. Mastering these telephone behaviours transforms phone interactions from potential career pitfalls into valuable opportunities to project competence and earn respect.

Week 5: Technology, Mobile Etiquette, and Digital Netiquette

Week 5 evaluates the profound impact of modern digital technology on human personality and interpersonal relationships. Drawing on Donna Haraway's concept of the "cyborg," the lecture explores how the blurring boundary between the biological and the mechanical causes individuals to treat machines with human-like care while treating people like cold machines.

Critical questions of control, benefit, and choice are raised, alongside Albert Einstein's warning that technology might eventually surpass human interaction.

The proliferation of mobile devices has turned humans into "moborgs" who succumb to nomophobia (mobile addiction) and obsessive-compulsive checking, displacing immediate relationships in favour of virtual connections.

To counter this, learners are urged to establish device-free boundaries, treat phones as utilitarian tools rather than masters, and practice mobile courtesy by silencing devices in formal meetings and avoiding texts when face-to-face communication is possible.

The curriculum also establishes professional written standards for digital correspondence, organizing them around the five cardinal principles of soft skills: planning, preparedness, persuasiveness, presentability, and perseverance.

Demonstrating the real-world fallout of unprofessional emails, the course highlights the hazards of missing salutations, all-caps text, colloquial slang, blended languages, and neglected grammar.

The week concludes with comprehensive guidelines for internet etiquette, or "netiquette". Because digital messages can be stored permanently and remain under the recipient's control, communicators must remember that there is a human being behind the screen, choose words with care, express emotional nuance through thoughtful language or emoticons, and uphold strict ethical standards.

Week 6: Communication Architecture, Barriers, and Non-Verbal Assessments

Week 6 investigates the mechanics of effective communication and the internal and organizational factors that disrupt it. Effective communication is defined as the deliberate ability to generate an intended response.

The communication process is modelled through Harold Lasswell's formula—

Who sends what to whom, through which channel, and with what effect.

A message's success depends on clarity, conciseness, conviction, timing, and genuine empathy. Communication breakdowns are traced to psychological filters within both sender and receiver, including mismatched frames of reference, encoding/decoding errors, and emotional interference.

At the organizational level, communication flows downward, horizontally, and upward through written, oral, and electronic channels. However, long reporting chains, administrative hierarchies, unnecessary transfer points, and a lack of workplace trust can severely distort information.

This distortion is illustrated through real-world examples of downward messaging errors and product development misunderstandings.

To address these challenges, communicators must adapt their choice of medium, remove fears surrounding change, and verify mutual understanding.

The week concludes by shifting attention toward non-verbal communication, administering pre-thinking assessments to uncover students' baseline knowledge and dispel widespread misconceptions regarding body language.

Week 7: Non-Verbal Dynamics, Universal Cues, and Evaluative Settings

Week 7 expands into non-verbal communication, noting that up to ninety-three percent of communication effectiveness is governed by body language. Because non-verbal cues stem from subconscious feelings and are difficult to fake, they serve as reliable indicators of authentic emotion.

Non-verbal behaviour five key functions: repeating, complementing, contradicting, regulating, or substituting for verbal statements.

The lectures cover the core domains of non-verbal analysis:

1. Kinesics: Body movement and gestures.
2. Facial expressions: Expressions displayed through the face.
3. Oculesics: Eye gaze.
4. Haptics: Touch.
5. Proxemics: Interpersonal space.
6. Chronemics: Time.
7. Paralinguistics: Vocal tone and pauses.

Learners are guided through the interpretation of non-verbal cues across three primary dimensions: immediacy (liking), arousal (responsiveness), and dominance (power balance).

Accurate interpretation requires applying the "3 Cs"—context, reading gesture clusters, and detecting baseline behavioural changes—while accounting for external factors like culture and temperature to avoid premature judgments.

The focus then shifts to evaluative scenarios like job interviews and group discussions. For interviews, candidates are coached on punctuality, dress codes, firm handshakes, consistent eye contact, and composed posture.

In group discussions, participants are cautioned against aggressive posturing, nervous fidgeting (such as leg shaking or nail-biting), or withdrawing into silence. Instead, they are taught to project calm confidence through open-palm gestures, pleasant facial expressions, and attentive nodding.

Week 8: Presentation Mastery, Reading Efficiency, and Human Relations

Week 8 covers public speaking, reading comprehension, and professional ethics. Public speaking anxiety is traced to its root causes: fear of humiliation, fear of the unfamiliar, and dread of the unexpected.

Presenters can overcome this stage fright by mastering their material, maintaining a confident self-image, channelling adrenaline into enthusiasm, and visualizing a standing ovation.

Professional delivery requires viewing the venue beforehand, welcoming attendees, articulating three or four main points clearly, and balancing informative content with engaging anecdotes.

Visual aids must be designed thoughtfully: presenters should use concise bullet points and clear fonts, avoid blocking the screen, and ensure spare copies are ready. Presenters must also maintain open postures, project their voices clearly, and avoid hiding behind podiums.

The final section explores effective reading techniques, explaining how reading broadens mental perspective and strengthens vocabulary.

Core techniques include:

1. Previewing/Sampling: To select relevant material.
2. Skimming: For main themes.
3. Scanning: For specific data.
4. Clustering: Words to improve reading speed.

The course concludes by reinforcing that professional competence and soft skills are meaningless without foundational trust and ethical integrity.

Governed by the golden rule—treating others as one wished to be treated—learners are reminded that circumstances do not create character, but merely reveal it.

Because professional and personal success rely on lasting goodwill, individuals must protect their integrity, refrain from betraying others in impulsive moments, and ensure their interactions leave people with a genuine sense of value.

Transcribed from the five uploaded photographs (pages 8–12). Minor formatting and paragraph spacing have been improved for readability

SWOC ANALYSIS

Strengths

Strong career commitment, interest in learning, patience to understand concepts and willingness to explore new things.

Weaknesses

Takes time to learn, limited teaching experience, beginner in technical skills and needs to improve public speaking.

Opportunities

Higher education, research opportunities, teaching practice and growing demand for computer science educators.

Challenges

Academic competition, rapid technological changes, long educational journey and balancing responsibilities.

External

Strengths

1.Strong career commitment

I am determined to achieve my dream of becoming a Computer Science Professor.

2.Interest in learning

I enjoy learning new concepts and exploring different areas of computer science.

3.Conceptual understanding

Once I understand a concept, I can develop a strong understanding of it.

4.Willingness to explore

I am interested in trying new things and improving myself through new experiences.

Weaknesses

1.Working style

Sometimes I take more time to understand new concepts.

2.Experiance

I have limited teaching and practical experience as a beginner.

3.Communication skills

I need to improve my public speaking and presentation skills.

4.Technical knowledge

I am still developing my programming and computer science fundamentals.

Opportunities

1.Higher education

I can pursue postgraduate studies and research to become a professor.

2.Growing technology field

New developments in AI, programming and computer science create opportunities for educators.

3.Academic activities

Seminars, workshops and conferences can help me gain knowledge and experience.

4.Teaching practice

Presentations and peer teaching can help me develop my teaching abilities.

Challenges

1.Academic competition

Getting qualified and securing a good teaching position can be competitive.

2.Rapid technological changes

I must continuously update my knowledge of new technologies.

3.Long-term preparation

Becoming a professor requires years of higher education and research.

4.Time management

Balancing studies, research and personal responsibilities can be challenging.

Action Plan: Closing the Gaps

1.Knowledge gap

Strengthen my programming and computer science fundamentals.

2.Communication gap

Practise English speaking, presentations and explaining concepts.

3.Experience gap

Participate in seminars, workshops and teaching activities.

Action Plan: Using Opportunities

- Use AI as a tool: Learn new concepts and improve my teaching and learning methods.
- Improve communication: Practise presentations and participate in academic discussions.
- Build academic projects: Develop technical projects and participate in research activities.
- Stay focused: Prepare for higher studies and work consistently towards my professor career.

4-Year Milestones Matrix

Year	Primary focus	Target deliverable
Year 1	C programming, English and fundamentals	Strong foundation
Year 2	Python, data structures and presentations	Technical and communication skills
Year 3	Projects, research and seminars	Academic portfolio
Year 4	Advanced subjects and higher-study preparation	B.E. completion and postgraduate plan

Career goal: To become a Computer Science Professor who inspires students through knowledge, guidance and effective teaching.

PROJECT PROPOSAL

Title: Smart Medicine Reminder System for Elderly People

Introduction

Many elderly people need to take medicines at different times of the day. Sometimes, they may forget to take their medicines at the correct time because of their busy routines, memory difficulties, or living alone. This can affect their daily health management.

The Smart Medicine Reminder System is a technology-based project designed to help elderly people remember their medicine schedules. It sends reminders at the correct time through a mobile application or an alarm. This system can make medicine management easier and help elderly people follow the schedule provided by their healthcare professionals.

Problem

Elderly people may need to take different medicines in the morning, afternoon, and evening. Remembering the correct time for every medicine can be difficult, especially when they have several medicines to take.

For example, an elderly person living alone may forget to take a medicine in the afternoon. Family members may not always be available to remind them. Traditional methods, such as writing medicine timings on paper, may not always be effective.

Therefore, a simple and reliable reminder system is needed to help elderly people remember their medicine schedules and provide greater convenience to their families.

Aim of the Project

The main aim of this project is to develop a smart system that reminds elderly people when it is time to take their medicines.

The system will allow users or their caregivers to enter medicine names and timings. It will provide timely reminders through alarms or mobile notifications. The project also aims to reduce confusion about medicine schedules and support elderly people in managing their daily routines more independently.

How the System Works

The Smart Medicine Reminder System will have a simple and user-friendly interface. First, the user or a family member can enter the medicine name, time, and other schedule details prescribed by a healthcare professional.

The system will store these details and compare the current time with the saved schedule. When the scheduled time arrives, it will send an alarm or notification to remind the user.

For example, if a medicine is scheduled for 8:00 AM, the system will provide a reminder at that time. The user can confirm that they have taken the medicine. If the reminder is not acknowledged, the system can send another notification or alert a designated caregiver, if that feature is enabled.

Main Features

The project will include several useful features to make medicine reminders simple and effective.

- Medicine Schedule: Users can enter medicine names and their prescribed timings.
- Automatic Reminders: The system will provide alarms or notifications at scheduled times.
- Repeat Notifications: It can remind users again if a reminder has not been acknowledged.
- Caregiver Alerts: Family members or caregivers can receive notifications when configured.

- Daily Medicine List: Users can view their medicine schedules for the day.
- Simple Interface: Large text, clear buttons, and easy navigation will help elderly people use the application.
- Reminder History: The system can maintain a record of acknowledged reminders.

Uses of the Project

This project can be useful for elderly people who live alone or need help remembering their daily medicine schedules. They can use the application to receive timely reminders without depending completely on family members.

It can also help family members and caregivers support elderly people, especially when they are not physically present. They can use the reminder and alert features to stay informed about scheduled reminders.

The system may also be useful for people who manage several medicines at different times of the day. However, it is intended only to provide reminders and does not replace medical advice or professional care.

Benefits

The main benefit of this project is that it helps elderly people remember their medicine schedules more easily. Automatic reminders reduce the need to remember every timing manually.

The simple interface can make the application convenient for elderly users. Caregiver notifications can provide additional support to family members. The daily schedule and reminder history can also help users organise their routines.

Overall, this project can improve convenience, support independence, and provide peace of mind to elderly people and their families.

Future Improvements

In the future, the system can be improved by adding voice reminders in regional languages such as Tamil and English. This will help elderly people who find reading notifications difficult.

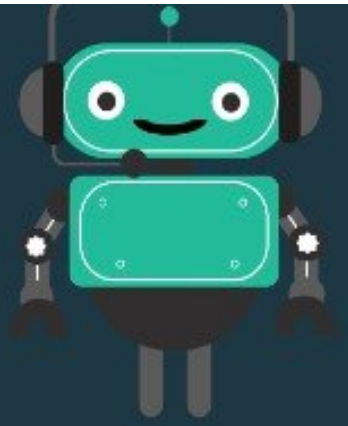

A smart pillbox with separate compartments and indicator lights can also be connected to the application. Voice assistants and wearable devices may be added to provide more convenient reminders.

Another improvement could be an emergency contact feature that alerts a caregiver when repeated reminders are not acknowledged. With additional development, the system could become more accessible and useful for elderly people with different needs.

Conclusion

The Smart Medicine Reminder System is a useful technology-based project designed to help elderly people manage their medicine schedules. By providing automatic reminders, daily schedules, and optional caregiver alerts, it can reduce confusion and make everyday routines easier.

This project combines technology with social responsibility by addressing a common problem faced by elderly people and their families. With further improvements, it can become a practical and user-friendly solution that supports independent living and better medicine management.

CEFR LEVEL

B2

What is a CEFR Level?

Good work! You are in a very good position to make improvements and raise your score! Listen to your speaking. What improvements could you make? Record a new answer to raise your score.

You will hear 6 questions. Listen to each question, then answer. For questions 1–2, you have 10 seconds to answer. For questions 3–6, you have 20 seconds to answer.

CEFR LEVEL

A2

What is a CEFR Level?

This is a good start on this new task. Now try to improve it. You can do it! Listen to your speaking. Then you can record a new answer.

You will see 8 sentences. You have 10 seconds to read and record each sentence.

My Learning Journey as a Fresher
As a fresher, I'm realizing that college is not just about attending classes and completing assignments. It's also about exploring new skills and discovering what interests me.
I'm trying to make the most of this new journey by learning something new every day and stepping out of my comfort zone.
I know I still have a lot to learn, but I'm enjoying the process of improving step by step.
Looking forward to learning, growing, and making the most of my college journey!
