Skills

C, MySQL, Python (learning), Robotics (basics), Linux (learning), Windows, Lovable, Anti-Gravity, Gamma AI, Figma AI (learning)

I am a first-year Computer Science student with working skills in C, MySQL and Python and a basic understanding of robotics. My next step is to build strong programming fundamentals, practise problem-solving on my own and join hackathons. This path suits me because autonomous systems need solid software skills, and I want to build them from the start.

Experience

I am a first-year BE Computer Science and Engineering student at St Joseph's College of Engineering (2026–2030). I build prototypes with Lovable and Anti-Gravity, and I am learning Python and Linux. My goal is to become an autonomous systems software engineer.

Hackathons and career training programs – 2026

Participated in hackathons and career training programs conducted in my college.

Education

BE Computer Science and Engineering – 1st Year

St Joseph's College of Engineering • Batch 2026–2030

Python course, Tutedude (in progress)

Planned: industry-recognised courses relevant to my domain (target: 2028–2029)

SWOC ANALYSIS DECK • BASED ON TEMPLATE PACK PART 3

Strategic Career Roadmap

11-slide outline: one block per slide. Targets and plans are labelled.

SLIDE 1

Title

Title: Strategic Career Roadmap: SWOC Analysis

Subtitle: Path to Autonomous Systems Software Engineer / Highly Skilled Autonomous Systems Engineer

Candidate: S K Jagat Senthil Vel | 1st Year, BE CSE | 2026–2030

Goal: I will build strong programming fundamentals early and grow into robotics, perception, planning and real-time software.

SLIDE 2

Executive Summary & Career Vision

1 Vision: I am a first-year CSE student at St Joseph's College of Engineering, growing toward a role as an autonomous systems software engineer.

2 Objective: I will build core computer and programming fundamentals (C, MySQL and Python), practise problem-solving on my own and take part in hackathons.

3 Framework: I will use the SWOC matrix to build a 4-year roadmap that closes my gaps and uses my opportunities.

SLIDE 3

SWOC Matrix at a Glance

Strengths (Internal): C, MySQL, Python, basics of robotics

Weaknesses (Internal): Procrastination; overthinking; still learning Python and Linux

Opportunities (External): NPTEL courses, hackathons, career training programs, assessments to prove myself

Challenges (External): Competition; fast-changing tools

SLIDE 4

Strengths

1 C programming: C is a core language for fast, low-level code, which real-time and embedded robotics software relies on.

2 MySQL: Database skills let me store and query data, such as logs and sensor readings.

3 Python: Python is widely used in robotics, perception and AI work.

4 Basics of robotics: A basic grounding in robotics links my software skills directly to my target field.

SLIDE 5

Weaknesses

Working style: Procrastination and overthinking slow me down. Fixing them matters because autonomous systems work needs steady, consistent practice.

Experience gaps: I am still learning Python and Linux. I have no projects, internship or completed certification yet.

SLIDE 6

Opportunities

1 NPTEL courses: Structured, recognised courses can strengthen my fundamentals.

2 Hackathons: They give me practice building under time pressure and working in a team.

3 Career training programs: They help me prepare for my domain.

4 Assessments: They let me measure my progress and prove my skills.

SLIDE 7

Challenges

1 Competition: Many students aim for the same roles, so I must stand out with real skills and work.

2 Fast-changing tools: Tools and frameworks change quickly, so I must keep learning.

SLIDE 8

Action Plan: Closing the Gaps

1 Procrastination and overthinking: I plan to set a fixed daily study time and a time limit for each decision, so I start on time and stop overthinking (planned).

2 Knowledge gap: I am learning Python and Linux now (in progress) and will practise problem-solving on my own alongside them.

3 Credential gap: I am completing a Python course on Tutedude (in progress). I plan to finish top-company certified courses for my domain by 2028–2029 (target).

SLIDE 9

Action Plan: Using Opportunities

1 Hackathons: I will take an active part in hackathons in my first year (planned).

2 NPTEL courses: I plan to take NPTEL courses that strengthen my fundamentals (planned).

3 Career training programs: I will join programs that build my domain knowledge (planned).

4 Fast-changing tools: I will focus on fundamentals first, then use AI tools to build projects (planned).

SLIDE 10

4-Year Milestones Matrix

Year	Primary Focus	Target Deliverable	Target Credential
Year 1 (2026–2027)	Computer and programming fundamentals, C, Python, Linux, problem-solving, hackathons	Problem-solving practice and hackathon participation (planned)	Tutedude Python course
Year 2 (2027–2028)	Master one programming language, more problem-solving	Projects and problem-solving practice (planned)	Top-tier ranking in that language (target)
Year 3 (2028–2029)	Projects combining AI tools with my own skills, hackathons, internships	Projects combining AI tools with my own skills (planned)	Top-company certified courses (target: 2028–2029)
Year 4 (2029–2030)	Internships, full awareness of my domain	Complete project work and internship experience (target)	Internship experience (target)

SLIDE 11

Conclusion & Key Takeaways

1 Technical base plus discipline: My skills in C, MySQL and Python are my main strengths, and fixing procrastination is my main task. Together they can turn potential into steady progress.

2 Fundamentals plus tools: Strong fundamentals in programming, MySQL and Linux let me use AI tools well instead of depending on them.

3 Verdict: Steady daily work on fundamentals, projects and hackathons will move me toward my goal of becoming an autonomous systems engineer.

About Me

STUDYING
I am a first-year BE Computer Science and Engineering student at St Joseph's College of Engineering (2026–2030), building a foundation in programming and computer fundamentals.

MY GOAL
Working toward becoming an autonomous systems software engineer and, longer term, a highly skilled autonomous systems engineer specializing in robotics, perception, planning and real-time software.

BUILDING
I build prototypes with Lovable and Anti-Gravity, and I use Gamma AI for presentations.

CURRENTLY LEARNING
Python, Linux, Figma AI (UI/UX ideation and design)

ASK ME ABOUT
C, Python, autonomous systems, robotics

FUN FACT
Besides C and Python, I also know MySQL well.

Tech Stack & Tooling

Domain	Technologies
Languages	C, Python (learning)
Databases	MySQL
Operating Systems	Windows, Linux (learning)
CI/CD & Version Control	GitHub
Prototyping & Design	Lovable, Anti-Gravity, Gamma AI, Figma AI (learning)

Career Roadmap

DONE	Started BE CSE at St Joseph's College of Engineering (2026)
DONE	Participated in hackathons and career training programs at my college (2026)
IN PROGRESS	Python course on Tutedude
IN PROGRESS	Learning Linux
GOAL	Complete top-company certified courses relevant to my domain (target: 2028–2029)
GOAL	Become a highly skilled autonomous systems engineer

Certifications & Achievements

Participated in hackathons and career training programs – My college – 2026

Python course – Tutedude – In progress

1st Year BE CSE	2026 – 2030	Autonomous Systems	C • MySQL • Python

HEADLINE

1st-Year CSE Student | C, Python, MySQL, Robotics Basics | Aspiring Autonomous Systems Software Engineer building strong software fundamentals

About

What does it take for a machine to see, plan and move on its own? That question is why I chose software.

I am a first-year BE Computer Science and Engineering student at St Joseph's College of Engineering (2026–2030). I am drawn to autonomous systems and robotics, especially perception, planning and real-time software.

My technical base is C, MySQL and Python, plus a basic understanding of robotics. I am still learning Python and Linux, and I build prototypes with tools such as Lovable and Anti-Gravity. In 2026 I took part in hackathons and career training programs at my college.

My goal is to become a highly skilled autonomous systems engineer. To get there, I am building strong fundamentals, practising problem-solving on my own, and taking up hackathons and projects. I plan to complete industry-recognised courses for my domain by 2028–2029.

I would like to connect with students, mentors and engineers working in autonomous systems and robotics. You can reach me at jagatsenthilvel12@gmail.com or see my work on GitHub: github.com/jagatsenthilvel12-hub

Education

St Joseph's College of Engineering

Bachelor of Engineering (BE), Computer Science and Engineering • 2026 – 2030 (currently in 1st year)

First-year BE Computer Science and Engineering student (2026–2030). Building strong fundamentals in programming and computer science, with a focus on C, MySQL and Python, plus a basic understanding of robotics. Learning Linux and taking part in hackathons and career training programs conducted by the college. Aiming to specialize in autonomous systems: robotics, perception, planning and real-time software.

Activities and societies: Hackathons and career training programs conducted by the college

ALEX KENDALL

A Biographical Note

Field	Embodied AI • Computer Vision • Robotics • Autonomous Driving
Role	Co-founder & CEO, Wayve
Education	University of Auckland • University of Cambridge

Prepared from the supplied research notes and source list

Executive overview

Alex Kendall is a New Zealand-born engineer, researcher and entrepreneur whose work sits at the intersection of deep learning, computer vision, robotics and autonomous driving. As co-founder and CEO of Wayve, he has pursued an end-to-end approach to self-driving in which machine-learning systems learn driving behaviour from data rather than relying primarily on large collections of manually programmed rules. His career combines hands-on engineering, academic research, startup leadership and a long-term willingness to work on difficult technical problems.

1. Who he is and his field

Alex Kendall is the co-founder and CEO of Wayve, a company that builds AI technology for self-driving vehicles. Wayve was founded in Cambridge, England, on 21 August 2017 by Kendall and Amar Shah, then two machine learning PhD students.

His field is embodied AI: intelligent systems that act in the physical world. At Cambridge he pioneered an end-to-end approach to self-driving, in which a deep-learning system uses computer vision to understand its surroundings and make driving decisions.

2. Formative years

Kendall says he grew up in the South Island of New Zealand, spending his time on mountain adventures or building technology. Raised in Christchurch, he went from high school straight into the second year of a mechatronics degree at the University of Auckland in 2011.

He later graduated first in his class. He chose mechatronics because it combined electrical, mechanical and software work. He spent much of his time in the lab, building drones and 3D-printing robots. He traces Wayve's roots to engineering projects on his family's farm in Canterbury and to those early university days.

After his degree he completed a PhD in deep learning, computer vision and robotics at Cambridge, and he worked on drone algorithms at the California start-up Skydio. He studied at Cambridge as a Woolf Fisher Scholar and was elected a Fellow of Trinity College in 2017.

3. Major milestones and achievements

In 2015 he contributed to SegNet, a deep-learning algorithm for real-time, pixel-level recognition on real driving footage. His PhD research won the 2018 BMVA Prize and the 2019 ELLIS Prize. He was named to the 2020 Forbes 30 Under 30 list. Shah left Wayve in 2020, and Kendall became CEO.

Funding followed. In January 2022 Wayve announced a $200 million Series B round to develop what it calls AV2.0. A University of Auckland article reports that he closed a $1.7 billion round in 2024. SoftBank led it, with Microsoft and NVIDIA taking part.

Wikipedia reports a collaboration among Nissan, Uber and Wayve on robotaxis, aiming for a Tokyo pilot by late 2026. In 2025 he received the Royal Academy of Engineering Silver Medal and was appointed an OBE for services to artificial intelligence.

4. Leadership and communication traits

Kendall credits his time as a resident adviser at O'Rorke Hall and his university hockey teams with building his early leadership skills. He says he has had to refine them as Wayve has grown.

As CEO he sets Wayve's direction and execution, working with the leadership team, partners and investors. He has built senior teams: Erez Dagan joined as president in 2024, and Jamie Shotton is chief scientist.

His explanations are plain. He says Wayve does not program rules such as “red light, stop.” It feeds the system data and lets it learn the patterns. He contrasts this with rules-based systems that grow more complex over time.

5. Professional ethics and resilience

Kendall says his approach was largely rejected in 2017. A year before the 2024 article, he could not even get meetings with car executives. He says he had “the resilience and belief to stick with it.”

He describes a problem-driven mindset and says hard problems are solved by sustained effort over many years, not by single eureka moments. His drone failed in front of a crowd at the university's Velocity Challenge when a rotor fell off mid-flight.

On ethics, the sources supplied for this note say little directly. The clearest statement is his hope that Wayve's technology will improve safety by anticipating and preventing collisions.

6. What I take away for my own engineering path

I am a first-year CSE student with working skills in C, MySQL and Python and a basic understanding of robotics. I am still learning Linux. Kendall began with hands-on building and strong fundamentals, and I plan to do the same by practising problem-solving daily and joining more hackathons.

His point about sustained effort speaks to my weakness of procrastination, so I will set a fixed daily study time (planned). His work on driving in difficult environments also encourages my own idea of autonomous navigation in Indian traffic.

Verification checklist

The following table preserves the claims and dates in the supplied research notes. It is designed as a quick reference for checking the final submission against the cited sources.

Date / period	Claim in supplied notes
2011	Began at the University of Auckland.
2015	Contributed to SegNet.
2017	Wayve founded on 21 August; elected Fellow of Trinity College.
2018	BMVA Prize for PhD research.
2019	ELLIS Prize.
2020	Forbes 30 Under 30; became Wayve CEO after Shah's departure.
Jan. 2022	$200 million Series B announced.
2024	$1.7 billion funding round reported by University of Auckland; Erez Dagan hired as president.
2025	Royal Academy of Engineering Silver Medal; appointed OBE.
Late 2026	Planned Tokyo robotaxi pilot.

Funding figure — source discrepancy

The supplied notes identify a $1.7 billion 2024 round, while Wikipedia is reported to place Wayve's total funding at about $1.3 billion. Because these figures may represent different measures (for example, a particular financing round versus cumulative funding), the course's accepted source should determine which figure is used in the final submission. This PDF retains the distinction rather than silently resolving the discrepancy.

Quoted material

The phrase “the resilience and belief to stick with it” is identified in the supplied notes as coming from the University of Auckland's Ingenio article (2024). “Red light, stop” is presented as an example phrase from the same source, not as a complete quotation.

Scope of ethics discussion

The supplied research notes explicitly caution that the available sources contain limited direct discussion of professional ethics. The final section therefore avoids overstating Kendall's ethical position and focuses on the reported safety motivation.

Personal plan

The daily study-time routine is correctly marked as planned rather than presented as an existing habit. This keeps the biographical facts separate from the student's own future intentions.

AUTONOMOUS NAVIGATION IN INDIAN TRAFFIC

PROJECT IDEATION CANVAS
AI • ROBOTICS • PERCEPTION • PLANNING • REAL-TIME SOFTWARE

01 PROBLEM DEFINITION

The engineering bottleneck: Indian traffic is highly dynamic and less structured than many controlled autonomous-driving environments. Cars, motorcycles, buses, auto-rickshaws, pedestrians, road obstacles and changing traffic conditions can create unpredictable situations.

Focused student problem: Build a navigation system that can perceive a controlled, campus-like environment and make safe real-time decisions around pedestrians, obstacles, intersections and moving objects.

02 PROPOSED TECHNICAL ARCHITECTURE

High-level workflow: Sensors → Perception → Localization → Planning → Decision → Control

Sensors: RGB camera; optional ultrasonic/LiDAR. Compute: laptop or Raspberry Pi/Jetson-class device.
Algorithms: Python/OpenCV and deep-learning models for object/road detection; visual landmarks or simulated coordinates for initial localization; A* or a local planner for path planning; control logic for steering and speed.
Development: simulation first, then a small-scale controlled robotic vehicle.

CAMERA / SENSORS	PERCEPTION Detect	LOCALIZATION Estimate	PLANNING Safe path	DECISION Act	CONTROL Move

03 TARGET USERS & IMPACT

Target users: autonomous-vehicle developers, mobility companies, campus transportation systems and robotics researchers.
Social impact: encourage safer navigation in complex traffic and focus research on local Indian road conditions.
Economic impact: develop skills and prototypes relevant to autonomous mobility, intelligent transportation and robotics industries.

04 FEASIBILITY & CONSTRAINTS

Tools: Python, OpenCV, Linux, Git/GitHub and a simulator such as CARLA; later, a small robot, camera and distance sensors.
Scope: simulation → controlled physical prototype. Public-road testing is outside the student prototype.
Constraints: compute, sensor cost, datasets, limited experience, safety and the complexity of real-world autonomous driving.

SUCCESS CRITERIA

1. Detect relevant objects reliably in a controlled scenario.
2. Estimate vehicle state sufficiently for navigation.
3. Generate a safe path around obstacles.
4. Execute stop/slow/turn decisions in simulation.
5. Demonstrate the system in a repeatable controlled environment.

WHY THIS IS REALISTIC

Start small. Do not attempt full autonomous driving immediately. Build one capability at a time: perception → localization → planning → control.
Long-term direction: progressively move from simulation to a small-scale vehicle while keeping safety and controlled deployment as non-negotiable constraints.

PROJECT POSITIONING: This is a student-scale autonomous-navigation research prototype inspired by the complexity of Indian traffic — not a claim of road-ready self-driving technology.

90-SECOND TEAM PITCH

PROBLEM • SOLUTION • PRACTICAL FEASIBILITY

01 PROBLEM

Indian roads create a unique challenge for autonomous vehicles. Unlike highly structured environments, our traffic can involve cars, motorcycles, buses, auto-rickshaws, pedestrians, obstacles and changing road conditions, often with unpredictable movement. The engineering problem we want to address is: how can an autonomous system safely understand and navigate this kind of complex environment?

02 SOLUTION

Our solution is an autonomous navigation system designed specifically with Indian traffic conditions in mind. The system will use cameras and, where possible, distance sensors to collect information about its surroundings. A perception module will identify objects, pedestrians and road boundaries. A localization module will estimate the vehicle's position, while a path-planning algorithm will determine a safe route. Finally, a control module will convert that decision into movement commands.

03 PRACTICAL FEASIBILITY

We are not proposing to immediately put an autonomous vehicle onto public roads. Our practical approach is to begin in simulation, using tools such as Python, OpenCV, Linux and a vehicle simulator such as CARLA. Once the software works reliably, we can move to a small-scale robotic vehicle operating in a controlled environment.

04 WHY OUR TEAM CAN BUILD IT

This makes the project achievable for a student team while giving us experience in computer vision, robotics, planning, AI and real-time software. Our long-term goal is to develop technology that can help make autonomous navigation more suitable for the realities of Indian traffic.

ONE-LINE VISION: Build from simulation to a safe, controlled prototype that learns to navigate the messy realities of Indian traffic — one engineering capability at a time.

Prepared for project ideation / hackathon / academic presentation

Speak & Improve — One-Page Summary

Official result shown: CEFR B1

Task details

Task: **Test 1**. The supplied result page shows an overall CEFR level for the speaking test. The visible test overview includes a section for answering questions about yourself.

Score table

Measure	Result
CEFR level shown	B1
Test	Test 1
Checked	4 October 2026

Error log

Area	Current record / next check
Grammar	No individual grammar-error count or transcript was provided. Focus on accurate sentence patterns and clear answers.
Vocabulary	No individual vocabulary-error count was provided. Practise useful words for personal topics and everyday speaking.
Pronunciation	No individual pronunciation score or error list was provided. Focus on clear sounds, word stress and steady speech.

4-week improvement plan

Week	Focus
1	Practise short answers about yourself. Aim for clear sentences and correct basic grammar.
2	Expand answers with useful vocabulary and simple reasons or examples. Speak clearly rather than rushing.
3	Practise speaking on familiar topics. Record yourself and listen for grammar, vocabulary and pronunciation issues.
4	Do a full speaking practice session. Review your recording and repeat difficult parts more clearly.

Reference point: this summary records only the official result information visible in the supplied Speak & Improve screenshot and does not invent additional scores or error counts.

Speak & Improve — CEFR Level B1

Write & Improve — Latest One-Page Summary

Task Details

Item	Details
Prompt	Reply to David about college friends visiting your area for a week's touring holiday.
Required content	Suggest places they could visit, including local area/history, and recommend the best way to travel: car, bike or coach.
Your response	Email to David with suggestions for places to visit and a recommendation about transport.
Feedback shown	The site says: "Good try. Read your writing again and study the feedback." It also advises looking for ways to improve the writing and raise the level.

Score Table

Measure	Latest Result
Platform / test	Write & Improve with Cambridge
Course level	B2 First
Part / question	Part 2 / Question 4
Task	A touring holiday — email response
Score	170
Level	B2
Result	Pass at Grade C

Error Log

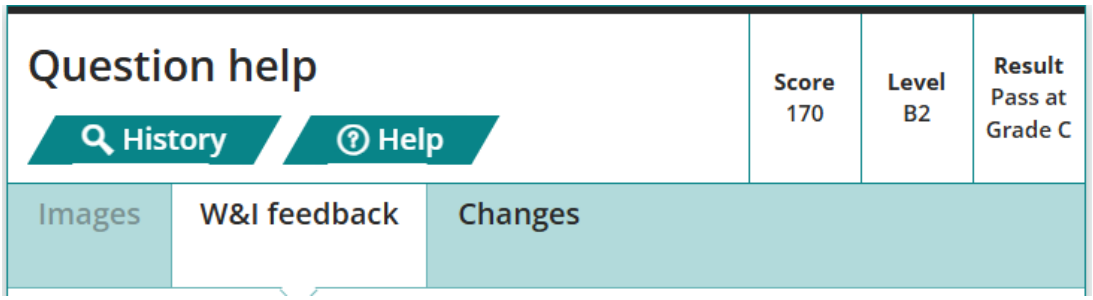

Area	Evidence / What to improve
Grammar	The screenshot does not give a numeric grammar-error count. Review sentence structure and grammatical accuracy carefully.
Vocabulary	No numeric vocabulary-error count is shown. Improve variety and precision of words for places, history, travel and recommendations.
Pronunciation	Pronunciation is not assessed by this Write & Improve writing result; no pronunciation score or error count is shown.

4-Week Improvement Plan

Week	Focus and action
Week 1	Grammar: review sentence structure, articles, prepositions, verb forms, and punctuation. Rewrite short email sentences clearly.
Week 2	Vocabulary: build useful B2-level phrases for travel, places, history, transport, and giving advice. Avoid repeated words.
Week 3	Writing practice: write short Cambridge-style emails and articles. Check paragraphing, linking words, tone, and task coverage before submitting.
Week 4	Final improvement: review feedback from new tasks, correct repeated mistakes, and practise writing under exam-style conditions.

Source basis: the latest Write & Improve screenshot supplied in this chat and the previously supplied personal facts sheet. No extra scores or error counts have been invented.

Write & Improve — Score 170, Level B2, Pass at Grade C

NPTEL 109104115 — Week-by-Week Course Summary

Enhancing Soft Skills and Personality

Week 1 — Mindset and Growth Mindset

The first week establishes the foundation for personality development by revisiting major ideas from the earlier Developing Soft Skills and Personality course and then focusing on mindset. The lecturer distinguishes between different ways people approach learning, challenges, abilities, and personal improvement. A central idea is that the way a person thinks about ability influences how they respond to difficulty. The course introduces the distinction between fixed and growth mindsets, with the growth approach emphasizing learning, effort, adaptation, and improvement rather than treating ability as permanently limited. The lecturer also discusses learning mindsets, encouraging learners to view mistakes and difficult situations as opportunities to develop rather than as evidence of failure. The idea of developing a growth mindset is presented as a practical process rather than simply a positive slogan: individuals need to examine their assumptions, remain open to feedback, learn from experience, and continue working when progress is slow. The key model is therefore the growth-mindset approach, supported by examples involving learning and personal development. For engineering students, the main lesson is that technical competence and professional effectiveness both improve when setbacks are treated as feedback rather than as fixed judgments about ability.

Week 2 — Time Management and Procrastination

Week 2 concentrates on time management, particularly how people perceive, use, and waste time. The lecturer examines the importance of understanding one's relationship with time before attempting to manage it effectively. Efficient time use requires awareness of priorities, disciplined allocation of available time, and deliberate control over activities that consume attention without producing useful results. A major topic is procrastination, where an individual delays an important task even though completing it would be beneficial. The course examines why people procrastinate and then moves toward methods for overcoming the habit. Another important idea is learning to avoid automatically saying “yes” to make others happy. Agreeing to every request can create excessive commitments and interfere with important responsibilities. Thus, effective time management involves not only scheduling tasks but also setting boundaries and making conscious choices about commitments. The lecturer connects delay, priorities, and personal discipline, showing that managing time is closely related to managing oneself. The key models here are time-management principles, procrastination analysis, and boundary-setting through appropriate refusal. For engineering teams, these ideas apply directly to project deadlines, task prioritization, meeting overload, and avoiding delays that can affect an entire development schedule.

Week 3 — People, Saying No, Anger and Positive Thinking

Week 3 develops interpersonal effectiveness by examining different types of people and the way individuals respond to other people's expectations and behaviour. A particularly practical skill is learning how to say “no” appropriately. The objective is not simply to reject requests, but to protect priorities and communicate boundaries without unnecessarily damaging relationships. The week also addresses anger control, emphasizing the importance of managing emotional reactions rather than allowing anger to determine communication or decisions. Positive thinking is then introduced as a way of changing one's response to difficult situations. Rather than treating positivity as ignoring problems, the approach encourages people to look for constructive possibilities and use difficult experiences for learning and improvement. The lecturer's treatment connects interpersonal behaviour with self-management: understanding different people helps a person communicate more effectively, while controlling anger prevents emotional reactions from damaging relationships. The positive-thinking discussions further reinforce the growth-oriented approach introduced earlier. Key concepts include people-type awareness, assertive refusal, anger management, and positive thinking. In an engineering environment, these skills are especially useful when engineers disagree about designs, deadlines, priorities, or technical decisions. Being able to refuse unrealistic requests professionally, remain calm during disagreement, and look for solutions rather than blame can make teamwork considerably more productive.

Week 4 — Likeability, Relationships and Personal Attractiveness

Week 4 focuses on how personal behaviour influences the way other people respond to us. The lecturer first considers behaviours that can cause people to dislike or avoid someone, encouraging learners to examine habits that negatively affect interpersonal relationships. The discussion then moves to characteristics that make people more likeable and attractive in a broader social and professional sense. Here, attractiveness is not limited to physical appearance; it concerns qualities in behaviour, communication, attitude, and interaction that create positive impressions. The week encourages learners to understand that relationships are influenced by how people listen, respond, cooperate, and make others feel. Developing a pleasant personality therefore requires awareness of one's own behaviour as well as sensitivity toward other people. The two-part treatment of both likeability and attractiveness reinforces the idea that personality is expressed through repeated patterns of interaction. Rather than attempting to impress everyone, the learner is encouraged to develop socially effective habits that support trust and positive relationships. The key framework is the people-skills approach to likeability and interpersonal attractiveness. In engineering teams, this matters because technical knowledge alone does not determine collaboration quality. Engineers need to explain ideas respectfully, listen to colleagues, accept different viewpoints, and create an environment in which team members are comfortable sharing concerns and suggestions.

Week 5 — English Skills and Common Errors

Week 5 concentrates on English-language skills, particularly common errors that can affect professional communication. The five lectures systematically address recurring problems in English usage and encourage learners to become more careful and accurate communicators. The broader purpose is not simply grammatical correctness for examinations; effective language is important because engineers regularly communicate through emails, reports, presentations, documentation, meetings, and technical discussions. Errors can sometimes make an otherwise strong idea unclear or create an unintended impression about the writer or speaker. The week's structure around common errors therefore promotes awareness, self-correction, and deliberate improvement. The course's broader soft-skills perspective also suggests that communication competence complements technical expertise: an engineer may understand a technical problem but still struggle professionally if the explanation is unclear. The key approach is error awareness followed by correction and practice. Instead of memorizing isolated rules, learners can use recurring mistakes as indicators of areas requiring further attention. For engineering teams, this has direct relevance to technical documentation, issue reports, project updates, requirements, presentations, and communication with clients or managers. Clear English helps teams exchange technical information efficiently and reduces misunderstandings, particularly when people from different educational, linguistic, or professional backgrounds work together.

Week 6 — Humour, Money and Personality

Week 6 examines two less obviously technical aspects of professional life: humour and money. The first part explores humour as a form of communication and considers its role in the workplace. Used appropriately, humour can make communication more engaging, reduce monotony, and contribute to positive interpersonal relationships. However, workplace humour also requires awareness of context and other people's reactions, because humour that is unsuitable for a particular situation can damage relationships instead of improving them. The lecturer therefore treats humour as a communication skill that requires judgment rather than as something automatically beneficial. The second part examines money and personality, followed by managing money. This broadens personality development beyond communication and relationships into practical self-management. Financial behaviour can influence stress, priorities, responsibility, and personal decision-making, so managing money is connected to overall professional and personal stability. The key concepts are humour as a communication tool, workplace appropriateness, money-personality relationships, and financial self-management. For engineering teams, humour can help create a friendly atmosphere when used respectfully, but it should never interfere with professionalism or make colleagues uncomfortable. Financial-management ideas are also relevant to engineers managing project resources, budgets, purchasing decisions, or their own professional responsibilities.

Week 7 — Health, Personality and Relationships

Week 7 connects personality development with physical health, exercise, diet, sleep, and relationships. The underlying message is that professional effectiveness cannot be separated completely from personal well-being. The health

component begins by considering the importance of exercise and then discusses diet and sleep as parts of maintaining a healthy routine. These areas influence energy, concentration, mood, and the ability to handle everyday responsibilities. The week then turns toward love and personality and the management of relationships, extending the course's earlier discussion of interpersonal behaviour into a more personal dimension. The overall approach treats personality development as holistic: communication and professional behaviour are important, but they exist within a person's broader physical and emotional life. The lecturer therefore encourages learners to manage different areas of life rather than focusing exclusively on career performance. The key framework is holistic personality development through health and relationship management. For engineering teams, the practical connection is especially relevant to sustained project work. Engineers working under deadlines need concentration, energy, emotional stability, and healthy routines. Teams also benefit when members manage personal pressures responsibly and communicate respectfully with colleagues. Maintaining well-being can therefore support reliability, better decision-making, and more consistent professional performance.

Week 8 — Ethics, Etiquette, Memory and Environment

The final week brings together professional and personal responsibility through ethics, etiquette, business etiquette, memory, and environmental care. Ethics concerns the principles that guide responsible behaviour, while etiquette concerns appropriate conduct in social and professional situations. Business etiquette applies these ideas specifically to workplace interactions, where behaviour can influence trust, credibility, and professional relationships. The week then moves to managing the mind and memory, followed by methods for improving memory. This reinforces the course's emphasis on self-management: professional effectiveness depends not only on what people know but also on their ability to focus, remember, learn, and use information effectively. The final topic, care for the environment, expands responsibility beyond individual and organizational concerns toward society and the wider world. The course therefore ends by presenting personality development as a combination of ethical conduct, professional behaviour, mental effectiveness, and social responsibility. Key concepts include ethical behaviour, business etiquette, mind and memory management, memory improvement, and environmental responsibility. For engineering teams, these principles apply to honest reporting, responsible technical decisions, respectful workplace behaviour, retaining important project knowledge, and considering environmental consequences when designing systems or products.

How I will apply this in engineering teams

I will apply the course by combining technical skills with professional behaviour. I will use a growth mindset when facing difficult technical problems, manage time and avoid procrastination, communicate boundaries clearly, and stay calm during disagreements. I will improve my English for reports, emails, presentations, and technical discussions. In team settings, I will listen to others, communicate respectfully, use humour appropriately, and build positive working relationships. I will also maintain healthy work habits, act ethically, follow professional etiquette, protect project information, and consider environmental impact when making engineering decisions. This will help me become not only a technically capable engineer but also a reliable and effective team member.

EN25C09: Professional English - I (LAB INTEGRATED)
MODEL EXAM I - PRACTICE WORKSHEET (ANSWERS)

Name: S K Jagat Senthil Vel **Roll No:** 26CS377 **Class:** CSE C
Department: B.E. Computer Science and Engineering (First Year)
College: St. Joseph's College of Engineering, OMR, Chennai - 119
Date: 23 October 2026

PART - A (15 x 1 = 15 Marks)

1. monitors

2. recorded

3. stronger

4. must

5. can

6. The laboratory developed a new testing device that measures material strength with high precision.

7. rises

8. would not have failed

9. The mechanics installed dual damper springs to isolate chassis resonance.

10. optimizing

11. 50 mL of hydrochloric acid was poured into the titration flask.

12. smoothly

13. The project supervisor asked the engineer whether he had calibrated the pressure sensor before testing.

14. Incorrect noun form: "equipments". Correct sentence: The laboratory purchased several new pieces of equipment for conducting material testing.

15. worse

PART - B (10 x 2 = 20 Marks)

1. The engineer calibrated the pressure sensor and verified its accuracy.

2. **Portability:** A laptop is more portable than a desktop computer.
Screen size: A desktop computer usually has a larger screen than a laptop.

3. The engineer designed a new cooling system, which reduces the temperature of industrial machines.

4. (a) If the battery voltage drops below the required level, the backup system will switch on automatically.
(b) If the technician had checked the connections earlier, the fault would have been detected before the test.

5. The solution was heated to 80°C before testing.

6. The project manager asked the technician whether he had inspected the pressure valves before starting the compressor.

7. (a) The engineer received a lot of feedback on the new design.
(b) The students received several pieces of useful advice from their teacher.

8. (a) The technician wears safety gloves to protect his hands.
(b) The cooling fan prevents the motor from overheating by operating continuously.

9. (a) efficiently
(b) carefully

10. (a) can
(b) must not

PART - C (5 x 13 = 65 Marks)

Question 26

26. a) Safety instructions for safe and responsible use of the internet

1. Use a strong password of at least 12 characters for every account.
2. Turn on two-factor authentication wherever it is available.
3. Do not click on links or attachments from unknown senders.
4. Check the website address and look for "https" before entering any personal details.
5. Never share your OTP, PIN or password with anyone.
6. Keep your operating system, browser and antivirus software updated.
7. Avoid public Wi-Fi for banking or other private work. Use a trusted network or a VPN.
8. Report cyberbullying, fraud or suspicious activity to the cyber crime portal or your institution at once.

Question 27

Selected Question: 27.a

Outline

- **Introduction:** Thanjavur painting, its origin in the Chola period and growth under the Nayak and Maratha rulers.
- **Body Paragraph 1:** Traditional practice: materials, gold foil, themes and master-to-student training.
- **Body Paragraph 2:** Present problems and modern initiatives to involve young people.
- **Conclusion:** Thanjavur painting carries our history and faith. The young generation must learn it, buy it and share it.

Essay: Thanjavur Painting: A Living Heritage of Tamil Nadu

Tamil Nadu has many traditional art forms. One of the most admired is Thanjavur painting. It began in the Thanjavur region during the Chola period and grew strongly under the Nayak and Maratha rulers between the 16th and 18th centuries. Temples and royal courts supported the artists, and the art became a symbol of devotion and pride.

Artists paint on wooden planks covered with cloth and a paste of chalk and gum. They draw a deity, usually Lord Krishna, Lord Shiva or Goddess Lakshmi, at the centre. They then add thin gold foil, semi-precious stones and rich colours. The gold glows in changing light. Each piece takes weeks of patient work, and the skill passes from master to student.

Today this art faces problems. Young people find it hard to earn a steady income from it, and cheap printed copies reduce demand. Modern initiatives can help. The Geographical Indication tag protects the authenticity of Thanjavur paintings. Schools and colleges can organise workshops and studio visits. Online platforms can help artists sell directly to buyers around the world. Short videos and digital archives can record the technique and attract young viewers. Artists can also apply the same method to modern products such as home décor and stationery.

In conclusion, Thanjavur painting is more than decoration. It carries the history and faith of our region. If young people learn it, buy it and share it, this art will live on.

Question 28

Selected Question: 28.b

Sender's Details / Date:
S K Jagat Senthil Vel
Roll No: 26CS377
B.E. Computer Science and Engineering (CSE C), First Year
St. Joseph's College of Engineering, Chennai - 119
Date: 23 October 2026

Recipient's Details:
The Principal
St. Joseph's College of Engineering
OMR, Chennai - 119

Subject: Request for permission to attend a technical workshop on Artificial Intelligence and Emerging Technologies

Salutation: Respected Sir/Madam,

Content / Body:
I am a first-year B.E. Computer Science and Engineering student of your college. I write to request your permission to attend a technical workshop on Artificial Intelligence and Emerging Technologies. St. Joseph's College of Engineering is organising it on 23 October 2026 at the college campus, OMR, Chennai - 119.

My objectives in attending are:
1. To understand the basic concepts of Artificial Intelligence and machine learning.

2. To learn how these technologies are used in robotics and autonomous systems.

3. To meet experts and learn about current industry practice.

I expect to learn practical skills and to gain a clearer view of career paths in this field. I will share what I learn with my classmates through a short presentation. This will also support my studies in the course Artificial Intelligence and Computational Thinking.

I request the following arrangements:
1. Permission for on-duty leave for the day of the workshop.

2. A permission letter that allows me to be absent from regular classes on that day.

3. Permission to use the seminar hall and laboratory facilities during the workshop sessions.

I assure you that I will attend all the sessions with discipline and will complete any classwork I miss. I would be grateful for your kind permission.

Thank you.

Sign-off:
Yours faithfully,
S K Jagat Senthil Vel
Roll No: 26CS377, CSE C

Question 29

Selected Question: 29.a

Comparative Matrix & Outline

- **Criteria 1 vs Criteria 2:** AI-based assessment vs teacher-based assessment.
- **Pros and Cons:** AI is fast, consistent and gives instant feedback, but it is weak at judging creativity and can carry data bias. Teachers understand context, effort and original thinking, but they are slower and can be affected by fatigue or personal bias.
- **Drafting Notes:** Cover accuracy, feedback time, fairness and human judgement. Conclude with a blended approach.

Essay: AI-Based vs Traditional Teacher-Based Assessment in Engineering Education

Assessment shows how well engineering students understand their subjects. Today, Artificial Intelligence (AI) tools can mark answers, while teachers have done this task for many years. Both methods have clear strengths and weaknesses.

AI-based assessment is highly accurate for objective work such as multiple-choice questions, numerical problems and programming tests. It applies the same rules to every answer and does not get tired. Its biggest advantage is speed. Students receive feedback within seconds, so they can correct mistakes while the topic is fresh. Teachers, in contrast, may take days or weeks to return marked papers, especially in large classes.

Fairness is a more complex issue. A machine does not favour any student because of appearance or past performance. However, AI can be unfair if it is trained on biased data. It may also fail to understand a correct answer written in an unusual way. Teacher-based assessment is open to personal bias and differences in marking between examiners. Even so, teachers can read the whole answer, recognise effort and reward original thinking.

This is where human judgement matters most. Engineering involves design, reasoning and ethics, and these cannot always be reduced to a score. A teacher can ask follow-up questions, guide weak students and give personal advice. AI cannot do this fully.

In conclusion, neither method is perfect. AI is best for quick, objective checking. Teachers are best for deep understanding and fair judgement. A blended approach, with AI for routine marking and teachers for final decisions, will serve engineering students best.

Question 30

Selected Question: 30.b

To: <friend's email address>

Subject Line: My first-year orientation programme at college

Salutation: Dear <friend's name>,

Opening / Check-in:
Hi! I hope you are doing well and enjoying your new college. I have been wanting to write to you since my orientation programme ended, so here is my news.

Core Experience / Details:
The orientation programme was held for all first-year engineering students at St. Joseph's College of Engineering. It began with a welcome address by the college management. Then senior faculty members spoke about the academic plan for the first year.

We took part in ice-breaking activities and group games. These helped me meet many new classmates, and I made my first few friends there. We were also taken around the campus. We saw the classrooms, laboratories, library and computer centre. I was happy to see so many facilities for learning.

The staff explained the college rules clearly. These included attendance requirements, dress code, discipline and the examination system. They also told us about clubs, sports and placement support.

The programme helped me understand college life. I now feel less nervous and more focused. I know what the college expects from me, and I have started planning my studies. I want to build a strong base in programming, as I wish to become an autonomous systems engineer.

Closing:
Please write and tell me about your college too. Let us meet during the holidays. Take care.

Your friend,
S K Jagat Senthil Vel

Updated English Learning & Digital Workbook Progress

This update records the latest results visible in the screenshots supplied for this record. Where an earlier portfolio page contains an older result, this page is the current update.

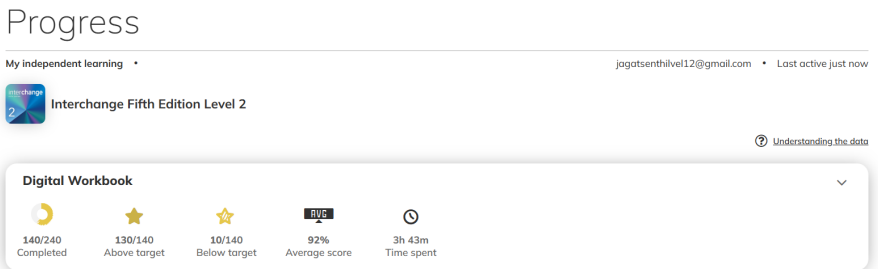

Platform / Activity	Latest result	Additional details
Interchange Fifth Edition Level 2 Digital Workbook	140 / 240 completed 92% average score	130 above target • 10 below target 3h 43m time spent
Write & Improve Cambridge	Score: 170 Level: B2	Result: Pass at Grade C
Speak & Improve	CEFR: B1	Test 1 • checked 4 October 2026
SwiftRead	207 WPM 100% comprehension	Reading speed test result shown in supplied screenshot

Progress note: The Interchange workbook shows 100 activities remaining (240 total minus 140 completed). The screenshot does not identify the specific units or the individual grammar/vocabulary items in the 10 below-target activities.

LinkedIn and GitHub evidence: The supplied profile screenshots show the GitHub README, tech stack, career roadmap, GitHub activity metrics, LinkedIn profile, About section, experience and education. These screenshots are included in the evidence appendix.

Student details used throughout: S K Jagat Senthil Vel • Roll No. 26CS377 • CSE C • EN25C09.

Interchange Fifth Edition Level 2 — Digital Workbook progress
